

## ASPHALT SAND

McCallum Bros. Ltd. has two grades of asphalt sand available for asphalt production.

Our asphalt sands offer manufacturers a consistent and compatible product with very high sand equivalence.

The key benefits of our grades of sand are as follows:

- **Low absorption** –Our asphalt sands have been thoroughly tested and absorption has been measured consistently at less than 0.4%.
- **Sand Equivalent** – Our asphalt sands typically have very high sand equivalents between 94 and 98%.
- **Cleanliness and Durability** - Our asphalt sands have been screened and washed and are free of clay and silt particles. Our products are entirely free of pumice.
- **Composition and compatibility** – Our asphalt sands are primarily comprised of feldspar and the particle shape is classified as angular to sub angular.
- **Consistency** – Due to our unique sourcing and washing process we are able to offer superior consistency compared to other suppliers in the market.
- **Moisture content** – McCallum Bros. Ltd. stores sand under shelters to deliver lower moisture contents to manufacturers.

Our asphalt sand is available throughout the Auckland region and in other regions by arrangement. Test results are available upon request.

Transport options- We can provide supply and deliver quotations to your site or work with your nominated transport operator.
