

EQ ARENA SAND

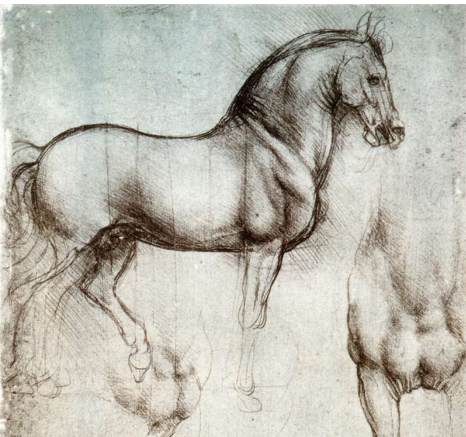

Our arena sand products have been in the market for over two years. We now have three grades of sand for horse arena surfaces with slightly different properties.

There are a number of factors to consider when selecting the correct sand for a horse arena surface. Almost every arena design and local environment is different and factors such as base construction, drainage system, site location and rainfall criteria should all be taken into consideration when choosing a surface material.

McCallum Bros. Ltd has spent considerable time and energy consulting with the industry at home and overseas. All our sand products are sourced from consented sustainable marine resources.

We can supply three grades of sand that will meet most requirements.

EQ1 – A clean white fine sand. This sand grade was originally developed for customers wanting a product similar to grades used in European arenas. This grade can be used with or without other footing materials and is normally applied at around 80 mm in depth. Has good drainage capability at 500 mm/hr.

EQ2 – A coarser white sand suitable for mixing with other footing materials and all round applications. Has less than 5% shell content and excellent hydraulic conductivity of 800-890 mm/hr. Is normally applied at 80-100mm in depth.

EQ3 – A mix of sand particles and crushed shell. Can be used "neat" or can be mixed with other footing materials.

Particle shape, cleanliness and durability - All EQ sand's have been screened and washed and are free of clay and silt particles. Our products are entirely free of pumice and the particle shape is classified as angular to sub angular.

Availability – EQ products are available all year round in the Auckland, BOP, Waikato and upper north island region.

Transport options- We can provide cost effective solutions for green field sites, arena renovation and top up projects.
