

CLASSIC CONCRETE DRIVEWAYS & FOOTPATHS

McCallum's Classic Concrete driveways and footpaths are known for their distinctive red rock look and have been specified and installed in the Auckland market place since the early 1900's.

Red Rock is made up of the stone chert, and it's colour is a natural expression of the trace element iron. It is a sedimentary rock that is lighter than Basalt but is tougher than common grey rock. Rich and warm earth tones vary from red to red brown.

Red Rock is perfectly suited to producing strong, hard wearing concrete. The rock shape and distribution of particles, delivers effective strength in concrete mixtures and durability in the finished product.

For that classic and lasting look specify McCallum's Classic Concrete.
